

FreeDOS Antivirus Emergency boot disk by ROSE SWE

Below you can download an image of a **FreeDOS boot disk (fav_boot)** suitable to boot your PC for **maintenance, backup, partitioning** and **virus scanning**. The disk contains anti virus tools (MBR-Kill, Quick Memory Scanner etc.) as well as other useful tools for maintenance (e.g. MBR-Info etc.).

This boot disk based on FreeDOS Beta 8 (<http://www.freedos.org>) was assembled by ROSE SWE, Ralph Roth (http://come.to/rose_swe)

FreeDOS kernel version 1.1.28 (Build 2028) [Dec 09 2002 21:55:02]
FreeCom version 0.83 Beta 54 [Nov 13 2002 22:21:04]

FreeDOS itself is covered by the GNU GPL License, however this floppy contains programs (c) by ROSE SWE. You can distribute the complete archive (disk) under the GNU license terms, but I would honour it to receive an email, when you are doing so, because as said above, it contains copyrighted stuff made by me. If you do enhancements to this floppy, let me know. My stuff is freeware, and falls not under the GNU GPL. NEVER REDISTRIBUTE MODIFIED FAV_BOOT images containing third party software!

This boot disk is immune against extended recursive partitions (also known as extended circular partitions) that prevents users accessing infected machines when booting MS/PC-DOS boot disks. I have tested this boot disk against the Emperor.5826 and Emperor.5832 virus known for extended recursive partitions.
